

The Tacoma Data Center delivers multi-tenant colocation, connectivity and managed services. Located in the heart of downtown, business and government clients receive the same services and level of excellence found in all Colocation Northwest data centers. This location also houses the Colocation Northwest Network Operations Center (NOC) which monitors all equipment, support infrastructure and security for Colocation Northwest, other IsoFusion subsidiaries and our clients.

With 5,000 square feet of flexible server and hardware colocation, the Tacoma data center delivers perfect colocation for small, large and enterprise size organizations. Opportunities range from single servers to fully enclosed locking 42U height cabinets to custom private cages. Like all Colocation Northwest data centers, Tacoma is SSAE 18 certified to meet national standards for availability and security. It complies with rigorous requirements for physical security such as 24/7 CCTV monitoring, electronic locks, and customer access controls.

The Tacoma data center connects with dark and lit fiber to the Westin Building Exchange, the major Pacific Northwest carrier hotel and our South Hill Seattle data center. As well as a regional network to other Colocation Northwest data centers in Bellevue and Redmond. Colocation customers can take advantage of direct carrier and online entity interconnection inside the Westin without secondary sites in carrier facilities. Colocation Northwest is an Internet service provider. Your blended Internet backbone will feature multiple Tier 1 and Tier 2 carriers.

With points of presence in the Bay Area, Los Angeles and Las Vegas the Colocation Northwest network links to three carrier hotels and other points of presence to west coast cable landing stations. In partnership with PCCW Global and Zenlayer, we offer unique solutions for remote colocation, low latency international connectivity, global WAN and points of presence, as well as, hybrid and multi- cloud.

Colocation Northwest offers comprehensive consulting and support services. Call us for help with any or all of the following: planning, procurement, deployment and configuration, or managed IT services such as monitoring, maintenance, upgrades and repairs. To complete your network, Colocation Northwest can provide internet service and connectivity to any location, even where other providers cannot.
